* Commercial refrigerator and freezer units, which go by many other names, were in use for almost 40 years prior to the common home models. They used gas systems such as ammonia (R-717) or sulfur dioxide (R-764), which occasionally leaked, making them unsafe for home use. Practical household refrigerators were introduced in 1915 and gained wider acceptance in the United States in the 1930s as prices fell and non-toxic, non-flammable synthetic refrigerants such as Freon-12 (R-12) were introduced. However, R-12 damaged the ozone layer, causing governments to issue a ban on its use in new refrigerators and air-conditioning systems in 1994. The less harmful replacement for R-12, R-134a (tetrafluoroethane), has been in common use since 1990, but R-12 is still found in many old systems today.

*Roof of the World is a metaphoric description of the high region in the world, also known as "High Asia", the mountainous interior of Asia.
The term is also used for parts of this region, for
- the Pamirs,
- the Himalayas
- Tibet
- Mt. Everest

The name was first applied to the Pamirs.
The British explorer John Wood, writing in 1838, described Bam-i-Duniah (Roof of the World) as a "native expression" (presumably Wakhi), and it was generally used for the Pamirs in Victorian times.
Older encyclopedias also used "Roof of the World" to describe the Pamirs:
Encyclopaedia Britannica, 11th ed. (1911): "PAMIRS, a mountainous region of central Asia...the *Bam-i-dunya* ('The Roof of the World')".
The Columbia Encyclopedia, 1942 edition: "the Pamirs (Persian = roof of the world)".

*Northern Rhodesia was a protectorate in south central Africa, formed in 1911 by amalgamating the two earlier protectorates of North-Western Rhodesia and North-Eastern Rhodesia. It was initially administered, as were the two earlier protectorates, by the British South Africa Company, (BSAC), a chartered company on behalf of the British government. From 1924 it was administered by the British government as a protectorate under similar conditions to other British-administered protectorates, and the special provisions required when it was administered by BSAC were terminated. Although under the BSAC charter it had features of a charter colony, the BSAC's treaties with local rulers and British legislation gave it the status of a protectorate. The Federation of Rhodesia and Nyasaland formed in 1953 was intensely unpopular among the African majority and its formation hastened calls for majority rule. As a result of this pressure, the country became independent in 1964 as Zambia. The geographical, as opposed to political, term "Rhodesia" referred to a region generally comprising the areas that are today Zambia and Zimbabwe. From 1964 it only referred to the former Southern Rhodesia.

* The most obvious property that changes is its state. When ice melts, water changes from a solid to a liquid. Other properties that change are its temperature and its total energy. For example, if ice has an initial temperature of -2 degrees Celsius and is heated, it will absorb heat energy. Its temperature will rise and its total energy will increase until it reaches 0 degrees C. Once the temperature of the ice reaches 0 degrees C, the ice continues to absorb heat and its total energy increases. All of the heat at this temperature goes into the change of state from solid to liquid, so the temperature remains at 0 degrees C. Once the ice has absorbed enough heat energy to melt, it forms liquid water at 0 degrees C. If the heating continues, the temperature of the resulting water rises once more, and the total energy of the water continues to increase. Another property that changes is its density. The density of ice is less than that of liquid water. However, when ice melts, the density of the resulting water is about 8% more dense than the original ice. But that's not all. As the temperature of the water increases from 0 degrees C, its density continues to increase. This behavior is contrary to that of nearly every other liquid. Then, at 4 degrees C, water reaches its maximum density. As the temperature increases above 4 degrees C, the density decreases. In practically all other substances, the solid form is more dense than the liquid form. For water, this difference has profound consequences, the most significant being that ice floats in cold water. When a pond or lake freezes in winter, the ice forms at the top, leaving liquid water below. Thus, the living organisms in the water can survive.
